

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings of claims in the application:

Listing of Claims:

1 1-25. (Cancelled)

1 26. (Original) A platform for use in sample analysis, said platform having one or
2 more sensing areas or regions, each for receiving a capture element or elements which when the
3 platform is irradiated with coherent light can interact to provide an indication of an affinity
4 reaction, wherein each capture element includes two or more types of capture molecule.

1 27-29. (Cancelled)

1 30. (New) The platform of claim 26, comprising an optically transparent substrate
2 having a refractive index (n_1), a thin, optically transparent layer, formed on one surface of the
3 substrate, said layer having a refractive index (n_2) which is greater than (n_1), said platform
4 incorporating therein one or multiple corrugated structures comprising periodic grooves which
5 define the one or multiple sensing areas or regions, said grooves being so profiled, dimensioned
6 and oriented that coherent light incident on said platform is diffracted into individual beams or
7 diffraction orders which interfere resulting in reduction of the transmitted beam and an anomalous
8 high reflection of the incident light thereby generating an enhanced evanescent field at a surface
9 of the one or more sensing areas.

1 31. (New) The platform of claim 30, wherein the enhanced evanescent field interacts
2 with luminescent material on or in the vicinity of one of the sensing areas or regions so as to
3 produce a detectable luminescent signal.

1 32. (New) The platform of claim 26, comprising an optically transparent substrate
2 having a refractive index (n_1), a thin, optically transparent layer, formed on one surface of the
3 substrate, said layer having a refractive index (n_2) which is greater than (n_1), said platform

4 incorporating therein one or multiple corrugated structures comprising periodic grooves which
5 define the one or multiple sensing areas or regions, said grooves being so profiled, dimensioned
6 and oriented that coherent and linearly polarised light incident on said platform is diffracted into
7 individual beams or diffraction orders which interfere resulting in a substantially total extinction
8 of the transmitted beam and an anormal high reflection of the incident light thereby generating
9 an enhanced evanescent field at a surface of the one or more sensing areas.

1 33. (New) The platform of claim 32, wherein the enhanced evanescent field interacts
2 with luminescent material on or in the vicinity of one of the sensing areas or regions so as to
3 produce a detectable luminescent signal.

1 34. (New) The platform of claims 31 or 33, wherein the luminescent material
2 comprises a fluorophore, and wherein the luminescent signal comprises a fluorescent signal.

1 35. (New) The platform of claims 30 or 32, wherein the center-to-center spacing
2 between each of the one or more sensing areas or regions is between about 1 μm and about 1
3 mm.

1 36. (New) The platform of claims 30 or 32, wherein said light incident on the
2 platform is incident on the side of the substrate having the optically transparent layer formed
3 thereon.

1 37. (New) The platform of claims 30 or 32, wherein said light incident on the
2 platform is incident on the side of the substrate that does not have the optically transparent layer
3 formed thereon.

1 38. (New) The platform of claim 32, wherein the polarized light has a polarization
2 that is substantially aligned with the orientation of the grooves in at least one of said sensing
3 areas or regions.

1 39. (New) The platform of claim 32, wherein the polarized light has a polarization
2 that is substantially perpendicular to the orientation of the grooves in at least one of said sensing
3 areas or regions.

1 40. (New) The platform of claim 30 or 32, wherein the grooves of at least one of said
2 corrugated structures are profiled, dimensioned and oriented such that the radiation loss
3 coefficient of the incident light within the at least one corrugated structure is on the order of
4 2000/cm or greater.

1 41. (New) The platform of claim 30 or 32, wherein the grooves of at least one of said
2 corrugated structures are profiled, dimensioned and oriented such that the propagation distance
3 of the incident light within the at least one corrugated structure is less than about 100 μm .

1 42. (New) The platform of claim 30 or 32, wherein the grooves of at least one of said
2 corrugated structures are profiled, dimensioned and oriented such that the propagation distance
3 of the incident light within the at least one corrugated structure is less than about 10 μm .

1 43. (New) The platform of claim 30 or 32, wherein the depth of the grooves is in the
2 range of about 50 nm to the thickness of the optically transparent layer.

1 44. (New) The platform of claim 30 or 32, wherein
2 the depth of the grooves is in the range of about 30 nm to the thickness of the
3 optically transparent layer,
4 the thickness of the optically transparent layer is in the range of 30 to 1000 nm,
5 the period of the corrugated structure is in the range of 200 to 1000 nm,
6 the ratio of groove depth to the thickness of the optically transparent layer is in
7 the range of 0.02 to 1, and
8 the ratio of grove width to the period of the grooves is in the range of 0.2 to 0.8.

1 45. (New) The platform of claim 32, wherein the polarized light has a linear
2 polarization component that gives rise to TM excitation in at least one of said sensing areas or
3 regions.

1 46. (New) Apparatus for analyzing samples comprising a platform according to
2 claims 30 or 32, and further including means for generating a light beam and for directing the
3 beam so that it is incident upon the platform on the side of the substrate having the optically
4 transparent layer disposed thereon at an angle which causes evanescent resonance to occur in at
5 least one sensing area of the platform to thereby create an enhanced resonant field in the at least
6 one sensing area of the platform, and means for detecting a characteristic of an affinity reaction
7 occurring on or in the vicinity of, or a characteristic of a material disposed on or in the vicinity
8 of, the at least one sensing area of the platform.

1 47. (New) Apparatus for analyzing samples comprising a platform according to
2 claims 30 or 32, and further including means for generating a light beam and for directing the
3 beam so that it is incident upon the platform on the side of the substrate that does not have the
4 optically transparent layer disposed thereon at an angle which causes evanescent resonance to
5 occur in at least one sensing area of the platform to thereby create an enhanced resonant field in
6 the at least one sensing area of the platform, and means for detecting a characteristic of an
7 affinity reaction occurring on or in the vicinity of, or a characteristic of a material disposed on or
8 in the vicinity of, the at least one sensing area of the platform.

1 48. (New) The platform of claim 26, wherein each type of capture molecule includes
2 a molecule selected from the group consisting of a nucleotide, an oligonucleotide, DNA, RNA,
3 PNA, an antibody, an antigen, a protein, an antibiotic, a drug, an enzyme, a ligand, a peptide, a
4 polymer, a molecular probe, a receptor, an indicator and a tissue sample.
